YOUSEF EMAD

Full Stack Developer | React · Node.js · TypeScript

Cairo, Egypt | +20 110 040 5722 | y.emad85@yahoo.com

linkedin.com/in/yousef-emad-702a64309 | github.com/y0emad | Arabic, English

SUMMARY

Full stack developer working mainly with React on the front end and Node.js, Express and TypeScript on the back end. Built and shipped ClinicFlow, a clinic booking app running live on AWS EC2 with Docker, HTTPS and a GitHub Actions pipeline, plus a JWT-secured food delivery API and a contract review system on Temporal with a React review console. Comfortable taking a feature from a Figma design through to a tested, deployed API.

TECHNICAL SKILLS

Frontend: React, TypeScript, JavaScript, React Query, React Router, Tailwind CSS, Ant Design, Material UI, Styled Components, Bootstrap, HTML, CSS, Vite

Backend: Node.js, Express, REST APIs, JWT, express-validator, FastAPI, GraphQL, Drizzle ORM, Mongoose, Sequelize, MVC

Databases: PostgreSQL, MongoDB, MySQL, Redis

DevOps: Docker, docker-compose, GitHub Actions, AWS (EC2, S3), Caddy, Apache Kafka, Temporal

Testing & Tools: Vitest, Jest, Supertest, Git/GitHub, Postman, Figma

PROJECTS

ClinicFlow: Clinic Booking App | React, TypeScript, Node.js, PostgreSQL, Docker, AWS

clinicflow-eg.duckdns.org · github.com/y0emad/Clinic-Flow

- Built a booking app for a single-doctor clinic: patients pick a service, a day and a free time slot, and the doctor manages services, working hours, days off and appointments from a dashboard.
- Blocked double booking in the database with a PostgreSQL exclusion constraint on appointment time ranges, so two patients booking the same slot at the same moment get one confirmation and one clear 409.
- Generated free slots in clinic time (Africa/Cairo, with daylight saving) from one function shared by the availability page and the booking endpoint.
- Built the React front end with Ant Design, Tailwind CSS and React Query: a calendar booking flow, role-based routes and a responsive layout.
- Wrote 30 integration tests (Vitest, Supertest) against a real PostgreSQL database, run by GitHub Actions on every pull request.
- Shipped the API and React build as one Docker image on AWS EC2 behind Caddy with automatic HTTPS, using Neon PostgreSQL and Brevo for email.

NASA Mission Control | React, Node.js, TypeScript, MongoDB, Docker, AWS

github.com/y0emad/Nasa

- Built a React client and a REST API in Node.js, Express and TypeScript, backed by MongoDB Atlas through Mongoose.
- Wrote Jest and Supertest integration tests, run by GitHub Actions on Node 20 and 22, and deployed the app as one Docker image on AWS EC2.

Contract Review Pipeline | Python, Temporal, FastAPI, React, TypeScript

github.com/y0emad/workspace

- Built a human-in-the-loop review pipeline on Temporal that survives worker restarts, with one child workflow per contract and an LLM step that writes one cross-contract risk report.
- Added a reviewer approve/send-back step through a Temporal update with a server-side validator; a run can wait up to 3 days for review without holding resources.
- Built the FastAPI service and a React + TypeScript review console with live status polling, RTL support and light/dark themes.

Swiggy Clone: Food Delivery Backend | Node.js, Express, TypeScript, MongoDB, Redis

github.com/y0emad/SwiggyApp

- Built auth, orders and sessions with JWT access/refresh tokens, MongoDB and Redis caching, and rewrote the Redis client as a singleton to stop connection problems.

Printing Press Web App (Graduation Project) | React, Figma

github.com/y0emad/FrontEndUser · github.com/y0emad/FrontEndAdmin

- Designed the full user and admin UI in Figma, then built both apps in React for Helwan University's printing press.

EDUCATION

B.Sc. Computers and Artificial Intelligence, Helwan University May 2024

Major: Information Systems · Minor: Computer Science
